## INTRODUCTION

“THE interpretation of dreams,” says Professor Freud in one place, “is the royal road to a knowledge of the part the unconscious plays in the mental life.”

Even standing alone this statement is sufficiently striking; it is at once a theory and a challenge. But it does not stand alone. It comes at the end of many years of research among every class of mental diseases. It comes, therefore, with the authentication of experience. It is not to be lightly set aside; it claims our study; and the study of it will not go unrewarded. The short essay here translated by Dr. Eder is but an introduction to the vast field opened up by Professor Sigm. Freud and his colleagues. Already the journals of clinical psychology, normal or morbid, are full of the discussions of Professor Freud's

methods and results. There is a "Freud School." That alone is a proof that the method is novel if not new. There are, of course, violent opponents and critical students. The opponents may provoke, but it is to the critical students that Professor Freud will prefer to speak. "The condemnation," said Hegel, "that a great man lays upon the world is to force it to explain him." Of a new method, either of research or of treatment—and the Freud method is both—the same may be said. It is certain that, whatever our prejudice against details may be, the theory of "psycho-analysis" and the treatment based upon it deserves, if only as a mental exercise, our critical consideration. But Professor Freud is not alone in the world of morbid psychology. Let me digress for a moment.

Over twenty years ago it was my special business to study and criticise several textbooks on insanity. To the study of these textbooks I came after many years of discipline in normal psychology and the related

sciences. When I came to insanity proper, I found that practically not a single textbook made any systematic effort to show how the morbid symptoms we classified as "mental diseases" had their roots in the mental processes of the normal mind. In his small book, "Sanity and Insanity," Dr. Charles Mercier did make an effort to lay out, as it were, the institutes of insanity, the normal groundwork out of which the insanities grew, the groups of ideas that to-day serve to direct our conduct and to-morrow lose their adjustment to any but a specially adapted environment. In his later works, particularly in "Psychology, Normal and Morbid," Dr. Mercier has followed up the central ideas of the early study. All the more recent textbooks in English contain efforts in the same direction; but with a few striking exceptions they are studies rather of physical symptoms associated with mental processes than of morbid psychology proper. It was not until there came from across the Channel Dr. Pierre

Janet's carefully elaborated studies on Hysteria that I realised what a wealth of psychological material had remained hidden in our asylums, in our nervous homes, even in our ordinary hospitals, and in the multitudes of strange cases that occur in private practice. Janet, a pupil of the Charcot School—Charcot, who made *la Salpêtrière* famous—pushed the minute analysis of morbid mental states into regions practically hitherto untouched. He was not alone. His colleague, Professor Raymond, and others in France and Germany, all work with the same main ideas. Janet's books read like romances. His studies on Psychological Automatism, the Mental State of Hystericals, Neuroses and Fixed Ideas, and many others on the part played by the unconscious, were such rich mines of fact and suggestion that Professor William James, in his "Principles of Psychology," said of them: "All these facts taken together, form unquestionably the beginning of an inquiry which is destined to throw a

new light into the very abysses of our nature." Curiously, not in this country—the country of great psychologists, Locke, Berkeley, Hume, Hartley, Thomas Reid, Dugald Stewart, Adam Smith, James Mill, John Stuart Mill, Bain, Spencer, among the dead, and whole schools of distinguished psychologists among the living—not in this country, but in America, was the value of the new material seriously considered. Here and there, within recent years, in this country, Janet's elaborate studies have not been fruitless; but I could not readily name any clinician in this country that has produced similar studies. It is to the continents of Europe and America, which in this field are in intimate touch, that we must go if we are to see the rich outgrowths of morbid psychology. I do not say that the work done by our English students of insanity is not, of its kind, as great and as important as any done in the world, but it is none the less true that, until a few years ago, the methods of Janet, Raymond,

Bernheim, Beaunis, not to speak of Moll, Forel, and Oppenheim, were practically unstudied here. In America it has been entirely different. Even the names of the men are now familiar in our English magazines—Muensterberg, Morton Prince, Boris Sidis, Ernest Jones, J. Mark Baldwin, not to mention William James and Stanley Hall. It looks as if every new idea unearthed in the Old World is put to the test by someone in the new. Britain remains curiously cold.

It would be interesting to ask the reason. Is it our metaphysical training? Is it the failure of the philosophical schools to realize the value of all this new raw material of study? Is it, perhaps, the fear that "the unity of consciousness" may be endangered by the study of Double Personality, Multiple Personality, Dissociation of Consciousness, Dormant Complexes, Hysterias, Phobias, Obsessions, Psychoneuroses, Fixed Ideas, Hysterical Amnesias, Hypermnesias, and the masses of other notions correlated,

roughly, under the term "unconscious" ? The suggestion of fear is not mere conjecture. Many years ago a distinguished student of philosophy, a pupil and friend of Sir William Hamilton, indicated to me, when I spoke to him of some recent work on Double Personality, that he had difficulty in placing the new work, feeling that, in admitting the possibility of multiple personality, he was sacrificing the primary concept of philosophy, the unity of consciousness. It did not perhaps occur to him that, when two so-called "persons" speak together, there are, in popular language, "two personalities" — each, no doubt, in a separate body, but each having his own "unity of consciousness."

If this be a fact, is there any greater difficulty in explaining the other fact that two persons may be, as James put it, under the same hat ? The metaphysical difficulty, if there be a difficulty, is neither more nor less in the one case than in the other. But it is needless to ask why a whole

field of study has been, relatively, neglected in this country. For now we have begun to make up leeway.

This translation by Dr. Eder is an introduction to the latest phase of the study of the unconscious. It brings us back to the point I began with, the relation of the normal to the morbid. Dreams are a part of everyone's normal experience, yet they are shown here to be of the same tissue, of the same mental nature, as other phenomena that are undoubtedly morbid. Dreams therefore offer in the normal a budding-point for the study of morbid growths. And the study of dreams by Freud came long after his studies of such neuroses as the phobias, hysterias, and the rest. To dreams he applied the same method of investigation and treatment as to the others, and he found that dreams offered an unlimited field for the same kind of study.

Perhaps, before going further, I should attempt to disarm criticism about the term "unconscious." We speak of subcon-

sciousness, co-consciousness, unconscious mind, unconscious cerebration; or what other terms should we use? Here it is better to avoid discussion, for we are concerned less with theory than with practice. And in Freud's work, whether we accept his theory or not, the practice is of primary importance. He takes the view that no conscious experience is entirely lost; what seems to have vanished from the current consciousness has really passed into a sub-consciousness, where it lives on in an organised form as real as if it were still part of the conscious personality. This view, with various modifications, is adopted by many students of morbid psychology. But there is another view. Muensterberg, for instance, maintains that it is unnecessary to speak of "subconsciousness," for every fact can be explained in terms of physiology. He would accept the term "co-conscious" or "co-consciousness"; but in one chapter he ends the discussion by saying: "But whether we prefer the physio-

logical account or insist on the co-conscious phenomena, in either case is there any chance for the subconscious to slip in? That a content of consciousness is to a high degree dissociated, or that the idea of the personality is split off, is certainly a symptom of pathological disturbance, but it has nothing to do with the constituting of two different kinds of consciousness, or with breaking the continuous sameness of consciousness itself. The most exceptional and most uncanny occurrences of the hospital teach after all the same which our daily experience ought to teach us: there is no subconsciousness" ("Psychotherapy," p. 157).

There are many refinements of distinction that we could make here, and if any reader is anxious to consider them, he will find some of them in a small volume on "Subconscious Phenomena," by Muensterberg, Ribot, and others (Rebman, London).

Here it is not of primary importance to come to any conclusion on the best term

to use or the complement theory of the facts. The discussion is far from an end; but the harvest of facts need not wait for the end of the discussion.

Meanwhile, let it be said that Professor Freud has been steeped in this whole subject from his student days. It is, however, less important to discuss his theory than to understand his method. The method is called "psycho-analysis." The name is not inviting, and it might apply to any form of mental analysis; but it is at least consistently Greek in etymology, and has taken on a technical meaning in the medical schools. What is the method?

Let it be granted that a person has undergone a strongly emotional experience—for example, a sudden shock or fright. If the person is highly nervous, the shock may result in some degree of dissociation. This may take the form of a loss of memory for certain parts of the experience. Let it be so. The ultimate result may be an unreasonable fear of some entirely harmless

object or situation. The person is afraid of a crowd, or afraid of a closed door, or has an intense fear of some animal or person. For this fear he can give no reason; he cannot tell when it began nor why it persists. He may more or less overcome it; but he may not. All through his future life he will go about with a helplessly unreasonable fear of a closed door (claustrophobia) or of a crowd (agoraphobia). Minor varieties of such an affection are to be found in every person's experience. On investigation, however, the root of the fear can be discovered: it is the product of the original emotional shock. The intellectual details of the emotional experience have completely vanished from the memory, but the emotion remains, and it is attached to some accidental object or circumstance present in the original experience. Thousands of illustrations could be given. They are, unfortunately, only too numerous. In this essay on the Interpretation of Dreams the reader will find many simple cases.

If, now, the person so affected is placed in a quiet room, if he is requested to concentrate his mind on the disturbing object or idea associated with his fear, if he is encouraged to observe passively the chance ideas which float up to him when he thus concentrates himself, if he utters, under the direction of his medical attendant, every such idea as it comes into his mind, there is a strange result. These ideas, coming apparently by chance from nowhere in particular, are, when carefully studied, found to be linked up with some past experience, dating, perhaps, from months or years away. If each idea as it emerges is followed up, if the other ideas dragged into consciousness by it are carefully recorded, it is found that sooner or later entirely forgotten experiences come into clear consciousness. There are many ways of helping this process. One of the ways is this: Let a series of words be arranged; let the doctor speak one of them to the patient; let the patient, in the shortest time possible

to him, say right out whatever idea is suggested to him by the word; let the time taken to make the response be recorded in seconds and fractions of a second—a thing easy enough to do with a stop-watch. Then, when the responses to a long series of words are all recorded, and the time each response has taken, it is found that some responses have taken much longer than others. This prolongation of the response-time is always found whenever the test word has stirred up a memory associated with emotion. By following up further the ideas stirred by this word, more ideas of a related kind are discovered, often to the patient's surprise. Things long forgotten come back to memory; circumstances that apparently had no relation to the present consciousness are found to be linked in sequence with it—emotions, unreasoning fears, anxieties, that apparently had no relation to any particular experience, are found at last to be part and parcel of things that happened long ago. Once the doctor

has his cue, he can range in many directions, and probe the mind again and again, until he reveals multitudes of suppressed memories, forgotten ideas, forgotten elements of experience. He can even get back into early childhood, which, to the patient himself, leaves many and many a blank area in the memory. But always the doctor lights, sooner or later, on some complex experience in which the particular fear or anxiety arose.

But now, if the case is a suitable one, a still stranger thing happens. When the forgotten experience has thus artfully been brought into the full light of consciousness, the patient finds himself satisfied with the explanation, and loses his particular fear. He can now go back over the whole history of its genesis; he can link up the old experience to the new, and so he attains once more satisfaction and peace of mind. Up till now he could not be reasoned out of his anxiety; he had always an answer for any explanation; he had always a fresh foolish

reason for his fear. Now all this vanishes. He finds his mind once more running smoothly, and his "phobia" gone. The unreasoning dread has been tracked back to its lair, and its lair has been destroyed in the process.

There are many other methods of achieving the same result; let this generalised sketch suffice.

What now is the theory? The theory is that the mental experience or "complex" had, for some reason and by some mechanism, been submerged, or suppressed, or forgotten. Freud maintains that there is a fundamental tendency in the mind to suppress every experience that is associated with painful emotion. This doctrine is allied to Bain's "Law of Conservation"—that painful experiences depress the vitality and tend to disappear, while pleasant experiences exalt the vitality and tend to remain in memory. At any rate, by some process the painful experience disappears from conscious memory, but it does not cease to

exist. It may lie dormant, or it may work subconsciously, and throw up the emotional bubbles that continue, without a known reason, to excite the ordinary consciousness. But the complex, though deep and partly dormant, never gets beyond reach. By the method of concentration, by the use of "free associations," by the following up of all the clues offered by the ideas "fished up," the submerged complex can, element by element, be brought back. When once it is brought back the patient is restored, the dormant complexes once more resume their place in the total current of his experience, and the mind flows at peace.

This is, roughly, the method of psychoanalysis. It has been applied in various types of neurosis—hysterias, obsessions, phobias, etc. It has not always succeeded in removing the morbid conditions, but it has succeeded so often that it may legitimately be regarded as a method of treatment. As a matter of discovery it is arduous, and demands the highest skill and invention if

it is to succeed. Incidentally it reveals masses of unpleasant ideas, of painful ideas, even of disgusting ideas; but, in the right hands, it leads to the healing of the mind.

MACBETH. How does your patient, doctor?

DOCTOR. Not so sick, my lord,  
As she is troubled with thick-  
coming fancies,  
That keep her from her rest.

MACBETH. Cure her of that;  
Canst thou not minister to a mind  
diseas'd;  
Pluck from the memory a rooted  
sorrow;  
Raze out the written troubles of the  
brain;  
And, with some sweet oblivious  
antidote,  
Cleanse the stuff'd bosom of that  
perilous stuff,  
Which weighs upon the heart?

DOCTOR. Therein the patient  
Must minister to himself.

And here, insensibly, we have passed into the World of Dreams. The morbid and the normal have come together. Dreams

are the awaking of dormant complexes; they are transfigured experiences; they come into consciousness trailing clouds of emotion, and fill the dreamer's imagination with mysterious images. It is here that the method of psycho-analysis most fascinates the student. It looks as if once more the "interpretation of dreams" had become a reality. The results of psycho-analysis, even when the method is applied with a master hand and the details are interpreted with a skill that comes only of a quick imagination, are not entirely convincing; but they are certainly such as to make more and more observation desirable. In the present short essay Professor Freud gives a sketch of psycho-analysis as it is applied to the interpretations of dreams. His examples, if they are enough to illustrate the theory, are hardly enough to prove it, but they are intended as an introduction to his more elaborate studies; and, hitherto, observers as they have increased in experience have gained in conviction. That the

method goes a long way to prove that dreams are not a chaotic sport of the brain, but are a manifestation of ordered mental experience, is beyond doubt. It would be easy to show where the theory does not cover facts, but it is equally easy to show many facts that it does cover.

What, then, is the theory? Briefly this, that dreams are very largely the expressions of unfulfilled desires. Where, as in children, the waking experience and the sleeping experience differ from each other by very little, the dream, or sleeping experience, readily takes the form of the ungratified desires of the day. But as the mind grows older the dream expression of a desire gets more intricate. By-and-by it is too intricate to be deciphered from direct memory, and then there is a chance for the method of psycho-analysis. What of the dream is remembered gives the cue for the analysis. Take a remembered element of a dream, track it back and back by free association or other method, and you will

find that, at one or two removes, the remembered element stirs up forgotten elements, and ultimately brings coherence out of incoherence.

This appears simple, but let the reader study the dreams analysed in this essay, and he will find himself stirred by a thousand suggestions. For Professor Freud has constructed empirical laws out of his masses of material. The dream as it appears to the dreamer he calls the *manifest dream ideas*. But as these are too absurd to form a coherent reality, he gives ground for believing that they represent *latent dream ideas*. The manifest dream is a mass of symbols representing elements in the latent dream ideas. How the latent dream ideas generate the manifest dream is discovered by psycho-analysis, the translation from the latent to the manifest is the effect of the *dream work*. The dream work is the very core of the difficulty. It is round this that Professor Freud's greatest subtleties of method are focussed. He

shows that every dream is linked to something that occurs on the previous day, some recent experience, but the experience emerges in the dream as part of the current panorama of the subjective life, and there is no date to the beginning of the panorama—it may go back to any point in the individual's history, even into the preconscious days of early infancy. The day's experience and the life's experience flow in a single stream, and the images that appear in dreams are but the symbols of all the latent ideas of that experience. How, by displacement of this element or that, compound symbols are formed; how, by the foreshortening of experience and the linking of the past with the present in a single idea, masses of old memories are clotted into a single point; how, in the freedom of the dream world, where the tension of the waking life is relaxed, where the exacting stimulations of the day are reduced, where the consciousness of duty to be done in the highly organised conditions of social conduct

is lowered, where, in a word, the *censor* is drowsy or asleep, where the dream symbols shape themselves into dramatic scenes of endless variety—these it is that Professor Freud's theory endeavours to set forth. Displacement, condensation, dramatisation—these are the short names for these long and complicated processes. In the course of his expositions, Professor Freud uses these processes almost as if they were demons, and he admits frankly their figurative character. But he pleads that they represent real processes, and is ready to accept better names when he finds them. To trace back the dream images to a definite meaning in experience is the aim of the psycho-analysis of dreams. And the successes in these must be tested by the facts. Sometimes the results are highly persuasive, sometimes they look highly fanciful, always they are full of suggestion and keep close to realities.

The dream symbolism, in particular, it is easy to criticise; but, after all, dream symbol-

ism is a reality. The point to investigate is, what dream images are legitimately considered symbolic and what not. One has only to remember that every word spoken or written is a symbol, and a symbol in much the same sense as the symbolism of dreams, for every written or spoken word is a complicated series of motions that express meanings. The dream images are complicated series of images that express meanings. The difficulty of symbolism is no greater in the one case than in the other. But the variety of dream symbols is so immense that the difficulties of tracing their meaning are enormous. It is here that the method meets its greatest difficulties; but, equally, it is here that it scores its greatest triumphs. Spoken or written language is a technically organised system of symbols; dream language is as yet a poorly organised system of symbols. The method of psycho-analysis aims at organising them. Some test results are described in this essay; multitudes of others are to be found in the

literature that is flowing from the application of the psycho-analytic method. Time alone will show how far the organisation of dream symbols into a definite "language of dreams" is, in any given society, actual or possible. But the effort of organisation has led Professor Freud to another fine fetch of theory, for his dream symbolism suggests many curious explanations for the mythologies of all ages and all countries. Myth symbols, that seem to defy explanation, he traces back to their roots in the "unconscious" of primitive man.

That the emotions of sex should play an enormous part in the processes of analysis is to be expected; for the sex emotions are among the deepest, if not the deepest, of our nature, and colour every experience. From their proximate beginning in infancy—and Freud's theory here is of immense significance—to their multiform derivatives in adult life, the sex emotions exercise an influence on every phase of development, and, in one form or another, are themselves

a normal index of the stages of development. It is therefore reasonable to expect that they should play a great part in the formation of obsessions, of fixed ideas, of perversions, of repressed complexes. In every civilisation, as Freud indicates, the sex emotions are the most difficult to control, and have demanded the greatest amount of restraint.

Restraints lead to repressions, repressions lead to dissociations, dissociations lead to irregularities of action. When, therefore, as in dreams, the restraints of the social day are withdrawn, naturally the repressed ideas tend to emerge once more. How much these ideas account for in the hysterias, how much "the shocks of despised love" affect even the normal life, needs no emphasis, but Freud pushes his analysis farther, and tracks the sex emotions, like many other fundamental emotions, into a thousand by-paths of ordinary experience. But it would be foolishness to say that sex emotions are everything in the ruins of the

“Buried Temple.” Far from it. What is true of the sex emotions is true of all other emotions in their varying degrees, and often what looks like predominant sex emotions may turn out to be accidental rather than causative, a concomitant symptom rather than the initiatory centre of disturbance. But these points are all controversial. It is the object of Freud to put them to the test. If his general theory be true, the dream-world will more and more become the revealer of our deepest and oldest experience.

It would be easy to fill many pages with illustrative items and relative criticisms, but that is not the purpose of an introduction. Here I am concerned simply to recommend this essay to the careful study of all those interested in the mental history of the individual, and in the blotting out from the mind of needless fears and anxieties. And no one need hesitate to enter on this study, whatever his metaphysical theories may be. Even the “unity

of consciousness" will not suffer, for, through his unending efforts to link the experiences of the day with the whole experience of the individual life, Professor Freud, by the union of buried consciousness, restores to the mind a new unity of consciousness.

Dr. Eder, whose studies in this field have been long and varied, does well to present to British readers this essay which serves as an introduction to the more elaborate studies of FREUD and his school, and I am glad to have the privilege of saying so.

W. LESLIE MACKENZIE.

## I.

IN what we may term “ prescientific days ” people were in no uncertainty about the interpretation of dreams. When they were recalled after awakening they were regarded as either the friendly or hostile manifestation of some higher powers, demoniacal and Divine. With the rise of scientific thought the whole of this expressive mythology was transferred to psychology; to-day there is but a small minority among educated persons who doubt that the dream is the dreamer’s own psychical act.

But since the downfall of the mythological hypothesis an interpretation of the dream has been wanting. The conditions of its origin ; its relationship to our psychical life when we are awake ; its independence of disturbances which, during the state of sleep, seem to compel notice ; its many pecu-

liarities repugnant to our waking thought ; the incongruence between its images and the feelings they engender ; then the dream's evanescence, the way in which, on awakening, our thoughts thrust it aside as something bizarre, and our reminiscences mutilating or rejecting it—all these and many other problems have for many hundred years demanded answers which up till now could never have been satisfactory. Before all there is the question as to the meaning of the dream, a question which is in itself double-sided. There is, firstly, the psychological significance of the dream, its position with regard to the psychical processes, as to a possible biological function ; secondly, has the dream a meaning—can sense be made of each single dream as of other mental syntheses ?

Three tendencies can be observed in the estimation of dreams. Many philosophers have given currency to one of these tendencies, one which at the same time preserves something of the dream's former

over-valuation. The foundation of dream life is for them a peculiar state of psychical activity, which they even celebrate as elevation to some higher state. Schubert, for instance, claims: "The dream is the liberation of the spirit from the pressure of external nature, a detachment of the soul from the fetters of matter." Not all go so far as this, but many maintain that dreams have their origin in real spiritual excitations, and are the outward manifestations of spiritual powers whose free movements have been hampered during the day ("Dream Phantasies," Scherner, Volkelt). A large number of observers acknowledge that dream life is capable of extraordinary achievements—at any rate, in certain fields ("Memory").

In striking contradiction with this the majority of medical writers hardly admit that the dream is a psychical phenomenon at all. According to them dreams are provoked and initiated exclusively by stimuli proceeding from the senses or the body,

which either reach the sleeper from without or are accidental disturbances of his internal organs. The dream has no greater claim to meaning and importance than the sound called forth by the ten fingers of a person quite unacquainted with music running his fingers over the keys of an instrument. The dream is to be regarded, says Binz, "as a physical process always useless, frequently morbid." All the peculiarities of dream life are explicable as the incoherent effort, due to some physiological stimulus, of certain organs, or of the cortical elements of a brain otherwise asleep.

But slightly affected by scientific opinion and untroubled as to the origin of dreams, the popular view holds firmly to the belief that dreams really have got a meaning, in some way they do foretell the future, whilst the meaning can be unravelled in some way or other from its oft bizarre and enigmatical content. The reading of dreams consists in replacing the events of the dream, so far as remembered, by other events. This is done

either scene by scene, *according to some rigid key*, or the dream as a whole is replaced by something else of which it was a *symbol*. Serious-minded persons laugh at these efforts—" Dreams are but sea-foam !"

## II.

ONE day I discovered to my amazement that the popular view grounded in superstition, and not the medical one, comes nearer to the truth about dreams. I arrived at new conclusions about dreams by the use of a new method of psychological investigation, one which had rendered me good service in the investigation of phobias, obsessions, illusions, and the like, and which, under the name "psycho-analysis," had found acceptance by a whole school of investigators. The manifold analogies of dream life with the most diverse conditions of psychical disease in the waking state have been rightly insisted upon by a number of medical observers. It seemed, therefore, *a priori*, hopeful to apply to the interpretation of dreams methods of investigation which had been tested in psycho-

pathological processes. Obsessions and those peculiar sensations of haunting dread remain as strange to normal consciousness as do dreams to our waking consciousness; their origin is as unknown to consciousness as is that of dreams. It was practical ends that impelled us, in these diseases, to fathom their origin and formation. Experience had shown us that a cure and a consequent mastery of the obsessing ideas did result when once those thoughts, the connecting links between the morbid ideas and the rest of the psychological content, were revealed which were heretofore veiled from consciousness. The procedure I employed for the interpretation of dreams thus arose from psychotherapy.

This procedure is readily described, although its practice demands instruction and experience. Suppose the patient is suffering from intense morbid dread. He is requested to direct his attention to the idea in question, without, however, as he has so frequently done, meditating upon it.

Every impression about it, without any exception, which occurs to him should be imparted to the doctor. The statement which will be perhaps then made, that he cannot concentrate his attention upon anything at all, is to be countered by assuring him most positively that such a blank state of mind is utterly impossible. As a matter of fact, a great number of impressions will soon occur, with which others will associate themselves. These will be invariably accompanied by the expression of the observer's opinion that they have no meaning or are unimportant. It will be at once noticed that it is this self-criticism which prevented the patient from imparting the ideas, which had indeed already excluded them from consciousness. If the patient can be induced to abandon this self-criticism and to pursue the trains of thought which are yielded by concentrating the attention, most significant matter will be obtained, matter which will be presently seen to be clearly linked to the morbid idea

in question. Its connection with other ideas will be manifest, and later on will permit the replacement of the morbid idea by a fresh one, which is perfectly adapted to psychical continuity.

This is not the place to examine thoroughly the hypothesis upon which this experiment rests, or the deductions which follow from its invariable success. It must suffice to state that we obtain matter enough for the resolution of every morbid idea if we especially direct our attention to the *unbidden* associations *which disturb our thoughts*—those which are otherwise put aside by the critic as worthless refuse. If the procedure is exercised on oneself, the best plan of helping the experiment is to write down at once all one's first indistinct fancies.

I will now point out where this method leads when I apply it to the examination of dreams. Any dream could be made use of in this way. From certain motives I, however, choose a dream of my own, which

appears confused and meaningless to my memory, and one which has the advantage of brevity. Probably my dream of last night satisfies the requirements. Its content, fixed immediately after awakening, runs as follows:

*“ Company ; at table or table d’hôte. . . . Spinach is served. Mrs. E. L., sitting next to me, gives me her undivided attention, and places her hand familiarly upon my knee. In defence I remove her hand. Then she says : ‘ But you have always had such beautiful eyes.’ . . . I then distinctly see something like two eyes as a sketch or as the contour of a spectacle lens. . . . ”*

This is the whole dream, or, at all events, all that I can remember. It appears to me not only obscure and meaningless, but more especially odd. Mrs. E. L. is a person with whom I am scarcely on visiting terms, nor to my knowledge have I ever desired any more cordial relationship. I have not seen her for a long time, and do not think there was any mention of her recently. No

emotion whatever accompanied the dream process.

Reflecting upon this dream does not make it a bit clearer to my mind. I will now, however, present the ideas, without premeditation and without criticism, which introspection yielded. I soon notice that it is an advantage to break up the dream into its elements, and to search out the ideas which link themselves to each fragment.

*Company ; at table or table d'hôte.* The recollection of the slight event with which the evening of yesterday ended is at once called up. I left a small party in the company of a friend, who offered to drive me home in his cab. "I prefer a taxi," he said ; "that gives one such a pleasant occupation ; there is always something to look at." When we were in the cab, and the cab-driver turned the disc so that the first sixty hellers were visible, I continued the jest. "We have hardly got in and we already owe sixty hellers. The taxi always

reminds me of the table d'hôte. It makes me avaricious and selfish by continuously reminding me of my debt. It seems to me to mount up too quickly, and I am always afraid that I shall be at a disadvantage, just as I cannot resist at table d'hôte the comical fear that I am getting too little, that I must look after myself." In far-fetched connection with this I quote:

"To earth, this weary earth, ye bring us,  
To guilt ye let us heedless go."

Another idea about the table d'hôte. A few weeks ago I was very cross with my dear wife at the dinner-table at a Tyrolese health resort, because she was not sufficiently reserved with some neighbours with whom I wished to have absolutely nothing to do. I begged her to occupy herself rather with me than with the strangers. That is just as if I had *been at a disadvantage at the table d'hôte*. The contrast between the behaviour of my wife at that table and that of Mrs. E. L. in

the dream now strikes me: “*Addresses herself entirely to me.*”

Further, I now notice that the dream is the reproduction of a little scene which transpired between my wife and myself when I was secretly courting her. The caressing under cover of the tablecloth was an answer to a wooer’s passionate letter. In the dream, however, my wife is replaced by the unfamiliar E. L.

Mrs. E. L. is the daughter of a man to whom I *owed money* ! I cannot help noticing that here there is revealed an unsuspected connection between the dream content and my thoughts. If the chain of associations be followed up which proceeds from one element of the dream one is soon led back to another of its elements. The thoughts evoked by the dream stir up associations which were not noticeable in the dream itself.

Is it not customary, when someone expects others to look after his interests without any advantage to themselves, to ask

the innocent question satirically: "Do you think this will be done *for the sake of your beautiful eyes?*" Hence Mrs. E. L.'s speech in the dream. "You have always had such beautiful eyes," means nothing but "people always do everything to you for love of you; you have had *everything for nothing.*" The contrary is, of course, the truth; I have always paid dearly for whatever kindness others have shown me. Still, the fact that *I had a ride for nothing* yesterday when my friend drove me home in his cab must have made an impression upon me.

In any case, the friend whose guests we were yesterday has often made me his debtor. Recently I allowed an opportunity of requiting him to go by. He has had only one present from me, an antique shawl, upon which eyes are painted all round, a so-called Occhiale, as a *charm* against the *Malocchio*. Moreover, he is an *eye specialist*. That same evening I had asked him after a patient whom I had sent to him for *glasses*.

As I remarked, nearly all parts of the

dream have been brought into this new connection. I still might ask why in the dream it was *spinach* that was served up. Because spinach called up a little scene which recently occurred at our table. A child, whose *beautiful eyes* are really deserving of praise, refused to eat spinach. As a child I was just the same; for a long time I loathed *spinach*, until in later life my tastes altered, and it became one of my favourite dishes. The mention of this dish brings my own childhood and that of my child's near together. "You should be glad that you have some spinach," his mother had said to the little gourmet. "Some children would be very glad to get spinach." Thus I am reminded of the parents' duties towards their children. Goethe's words—

"To earth, this weary earth, ye bring us,  
To guilt ye let us heedless go"—

take on another meaning in this connection.

Here I will stop in order that I may

recapitulate the results of the analysis of the dream. By following the associations which were linked to the single elements of the dream torn from their context, I have been led to a series of thoughts and reminiscences where I am bound to recognise interesting expressions of my psychical life. The matter yielded by an analysis of the dream stands in intimate relationship with the dream content, but this relationship is so special that I should never have been able to have inferred the new discoveries directly from the dream itself. The dream was passionless, disconnected, and unintelligible. During the time that I am unfolding the thoughts at the back of the dream I feel intense and well-grounded emotions. The thoughts themselves fit beautifully together into chains logically bound together with certain central ideas which ever repeat themselves. Such ideas not represented in the dream itself are in this instance the antitheses *selfish*, *unselfish*, *to be indebted*, *to work for nothing*. I could

draw closer the threads of the web which analysis has disclosed, and would then be able to show how they all run together into a single knot; I am debarred from making this work public by considerations of a private, not of a scientific, nature. After having cleared up many things which I do not willingly acknowledge as mine, I should have much to reveal which had better remain my secret. Why, then, do not I choose another dream whose analysis would be more suitable for publication, so that I could awaken a fairer conviction of the sense and cohesion of the results disclosed by analysis? The answer is, because every dream which I investigate leads to the same difficulties and places me under the same need of discretion; nor should I forgo this difficulty any the more were I to analyse the dream of someone else. That could only be done when opportunity allowed all concealment to be dropped without injury to those who trusted me.

The conclusion which is now forced upon

me is that the dream is a *sort of substitution* for those emotional and intellectual trains of thought which I attained after complete analysis. I do not yet know the process by which the dream arose from those thoughts, but I perceive that it is wrong to regard the dream as psychically unimportant, a purely physical process which has arisen from the activity of isolated cortical elements awakened out of sleep.

I must further remark that the dream is far shorter than the thoughts which I hold it replaces ; whilst analysis discovered that the dream was provoked by an unimportant occurrence the evening before the dream.

Naturally, I would not draw such far-reaching conclusions if only one analysis were known to me. Experience has shown me that when the associations of any dream are honestly followed such a chain of thought is revealed, the constituent parts of the dream reappear correctly and sensibly linked together; the slight suspicion that this concatenation was merely an accident

of a single first observation must, therefore, be absolutely relinquished. I regard it, therefore, as my right to establish this new view by a proper nomenclature. I contrast the dream which my memory evokes with the dream and other added matter revealed by analysis: the former I call the dream's *manifest content*; the latter, without at first further subdivision, its *latent content*. I arrive at two new problems hitherto unformulated: (1) What is the psychical process which has transformed the latent content of the dream into its manifest content? (2) What is the motive or the motives which have made such transformation exigent. The process by which the change from latent to manifest content is executed I name the *dream-work*. In contrast with this is the *work of analysis*, which produces the reverse transformation. The other problems of the dream—the inquiry as to its stimuli, as to the source of its materials, as to its possible purpose, the function of dreaming, the forgetting of

dreams—these I will discuss in connection with the latent dream-content.

I shall take every care to avoid a confusion between the *manifest* and the *latent content*, for I ascribe all the contradictory as well as the incorrect accounts of dream-life to the ignorance of this latent content, now first laid bare through analysis.

### III.

THE conversion of the latent dream thoughts into those manifest deserves our close study as the first known example of the transformation of psychical stuff from one mode of expression into another. From a mode of expression which, moreover, is readily intelligible into another which we can only penetrate by effort and with guidance, although this new mode must be equally reckoned as an effort of our own psychical activity. From the standpoint of the relationship of latent to manifest dream-content, dreams can be divided into three classes. We can, in the first place, distinguish those dreams which have a *meaning* and are, at the same time, *intelligible*, which allow us to penetrate into our psychical life without further ado. Such dreams are numerous; they are usually

short, and, as a general rule, do not seem very noticeable, because everything remarkable or exciting surprise is absent. Their occurrence is, moreover, a strong argument against the doctrine which derives the dream from the isolated activity of certain cortical elements. All signs of a lowered or subdivided psychical activity are wanting. Yet we never raise any objection to characterising them as dreams, nor do we confound them with the products of our waking life.

A second group is formed by those dreams which are indeed self-coherent and have a distinct meaning, but appear strange because we are unable to reconcile their meaning with our mental life. That is the case when we dream, for instance, that some dear relative has died of plague when we know of no ground for expecting, apprehending, or assuming anything of the sort; we can only ask ourself wonderingly: "What brought that into my head?" To the third group those dreams belong which are void of both meaning and intelligibility;

they are *incoherent, complicated, and meaningless*. The overwhelming number of our dreams partake of this character, and this has given rise to the contemptuous attitude towards dreams and the medical theory of their limited psychical activity. It is especially in the longer and more complicated dream-plots that signs of incoherence are seldom missing.

The contrast between manifest and latent dream-content is clearly only of value for the dreams of the second and more especially for those of the third class. Here are problems which are only solved when the manifest dream is replaced by its latent content; it was an example of this kind, a complicated and unintelligible dream, that we subjected to analysis. Against our expectation we, however, struck upon reasons which prevented a complete cognizance of the latent dream thought. On the repetition of this same experience we were forced to the supposition that there is an *intimate bond, with laws of its own, between*

*the unintelligible and complicated nature of the dream and the difficulties attending communication of the thoughts connected with the dream.* Before investigating the nature of this bond, it will be advantageous to turn our attention to the more readily intelligible dreams of the first class where, the manifest and latent content being identical, the dream work seems to be omitted.

The investigation of these dreams is also advisable from another standpoint. The dreams of *children* are of this nature; they have a meaning, and are not bizarre. This, by the way, is a further objection to reducing dreams to a dissociation of cerebral activity in sleep, for why should such a lowering of psychical functions belong to the nature of sleep in adults, but not in children? We are, however, fully justified in expecting that the explanation of psychical processes in children, essentially simplified as they may be, should serve as an indispensable preparation towards the psychology of the adult.

I shall therefore cite some examples of dreams which I have gathered from children. A girl of nineteen months was made to go without food for a day because she had been sick in the morning, and, according to nurse, had made herself ill through eating strawberries. During the night, after her day of fasting, she was heard calling out her name during sleep, and adding: "*Tawberry, eggs, pap.*" She is dreaming that she is eating, and selects out of her menu exactly what she supposes she will not get much of just now.

The same kind of dream about a forbidden dish was that of a little boy of twenty-two months. The day before he was told to offer his uncle a present of a small basket of cherries, of which the child was, of course, only allowed one to taste. He woke up with the joyful news: "Hermann eaten up all the cherries."

A girl of three and a half years had made during the day a sea trip which was too short for her, and she cried when she had

to get out of the boat. The next morning her story was that during the night she had been on the sea, thus continuing the interrupted trip.

A boy of five and a half years was not at all pleased with his party during a walk in the Dachstein region. Whenever a new peak came into sight he asked if that were the Dachstein, and, finally, refused to accompany the party to the waterfall. His behaviour was ascribed to fatigue; but a better explanation was forthcoming when the next morning he told his dream: *he had ascended the Dachstein*. Obviously he expected the ascent of the Dachstein to be the object of the excursion, and was vexed by not getting a glimpse of the mountain. The dream gave him what the day had withheld. The dream of a girl of six was similar; her father had cut short the walk before reaching the promised objective on account of the lateness of the hour. On the way back she noticed a signpost giving the name of another place for excursions;

her father promised to take her there also some other day. She greeted her father next day with the news that she had dreamt that *her father had been with her to both places.*

What is common in all these dreams is obvious. They completely satisfy wishes excited during the day which remain unrealised. They are simply and undisguisedly realisations of wishes.

The following child-dream, not quite understandable at first sight, is nothing else than a wish realised. On account of poliomyelitis a girl, not quite four years of age, was brought from the country into town, and remained over night with a childless aunt in a big—for her, naturally, huge—bed. The next morning she stated that she had dreamt that *the bed was much too small for her, so that she could find no place in it.* To explain this dream as a wish is easy when we remember that to be “big” is a frequently expressed wish of all children. The bigness of the bed re-

mind Miss Little-Would-be-Big only too forcibly of her smallness. This nasty situation became righted in her dream, and she grew so big that the bed now became too small for her.

Even when children's dreams are complicated and polished, their comprehension as a realisation of desire is fairly evident. A boy of eight dreamt that he was being driven with Achilles in a war-chariot, guided by Diomedes. The day before he was assiduously reading about great heroes. It is easy to show that he took these heroes as his models, and regretted that he was not living in those days.

From this short collection a further characteristic of the dreams of children is manifest—*their connection with the life of the day*. The desires which are realised in these dreams are left over from the day or, as a rule, the day previous, and the feeling has become intently emphasised and fixed during the day thoughts. Accidental and indifferent matters, or what must appear so

to the child, find no acceptance in the contents of the dream.

Innumerable instances of such dreams of the infantile type can be found among adults also, but, as mentioned, these are mostly exactly like the manifest content. Thus, a random selection of persons will generally respond to thirst at night-time with a dream about drinking, thus striving to get rid of the sensation and to let sleep continue. Many persons frequently have these comforting *dreams* before waking, just when they are called. They then dream that they are already up, that they are washing, or already in school, at the office, etc., where they ought to be at a given time. The night before an intended journey one not infrequently dreams that one has already arrived at the destination; before going to a play or to a party the dream not infrequently anticipates, in impatience, as it were, the expected pleasure. At other times the dream expresses the realisation of the desire somewhat indirectly; some

connection, some sequel must be known—the first step towards recognising the desire. Thus, when a husband related to me the dream of his young wife, that her monthly period had begun, I had to bethink myself that the young wife would have expected a pregnancy if the period had been absent. The dream is then a sign of pregnancy. Its meaning is that it shows the wish realised that pregnancy should not occur just yet. Under unusual and extreme circumstances, these dreams of the infantile type become very frequent. The leader of a polar expedition tells us, for instance, that during the wintering amid the ice the crew, with their monotonous diet and slight rations, dreamt regularly, like children, of fine meals, of mountains of tobacco, and of home.

It is not uncommon that out of some long, complicated and intricate dream one specially lucid part stands out containing unmistakably the realisation of a desire, but bound up with much unintelligible matter. On more frequently analysing the seem-

ingly more transparent dreams of adults, it is astonishing to discover that these are rarely as simple as the dreams of children, and that they cover another meaning beyond that of the realisation of a wish.

It would certainly be a simple and convenient solution of the riddle if the work of analysis made it at all possible for us to trace the meaningless and intricate dreams of adults back to the infantile type, to the realisation of some intensely experienced desire of the day. But there is no warrant for such an expectation. Their dreams are generally full of the most indifferent and bizarre matter, and no trace of the realisation of the wish is to be found in their content.

Before leaving these infantile dreams, which are obviously unrealised desires, we must not fail to mention another chief characteristic of dreams, one that has been long noticed, and one which stands out most clearly in this class. I can replace any of these dreams by a phrase expressing a

desire. If the sea trip had only lasted longer ; if I were only washed and dressed ; if I had only been allowed to keep the cherries instead of giving them to my uncle. But the dream gives something more than the choice, for here the desire is already realised ; its realisation is real and actual. The dream presentations consist chiefly, if not wholly, of scenes and mainly of visual sense images. Hence a kind of transformation is not entirely absent in this class of dreams, and this may be fairly designated as the dream work. *An idea merely existing in the region of possibility is replaced by a vision of its accomplishment.*

#### IV.

WE are compelled to assume that such transformation of scene has also taken place in intricate dreams, though we do not know whether it has encountered any possible desire. The dream instanced at the commencement, which we analysed somewhat thoroughly, did give us occasion in two places to suspect something of the kind. Analysis brought out that my wife was occupied with others at table, and that I did not like it; in the dream itself *exactly the opposite* occurs, for the person who replaces my wife gives me her undivided attention. But can one wish for anything pleasanter after a disagreeable incident than that the exact contrary should have occurred, just as the dream has it? The stinging thought in the analysis, that I have never had anything for nothing, is similarly con-

nected with the woman's remark in the dream: " You have always had such beautiful eyes." Some portion of the opposition between the latent and manifest content of the dream must be therefore derived from the realisation of a wish.

Another manifestation of the dream work which all incoherent dreams have in common is still more noticeable. Choose any instance, and compare the number of separate elements in it, or the extent of the dream, if written down, with the dream thoughts yielded by analysis, and of which but a trace can be refound in the dream itself. There can be no doubt that the dream working has resulted in an extraordinary compression or *condensation*. It is not at first easy to form an opinion as to the extent of the condensation; the more deeply you go into the analysis, the more deeply you are impressed by it. There will be found no factor in the dream whence the chains of associations do not lead in two or more directions, no scene which has not

been pieced together out of two or more impressions and events. For instance, I once dreamt about a kind of swimming-bath where the bathers suddenly separated in all directions; at one place on the edge a person stood bending towards one of the bathers as if to drag him out. The scene was a composite one, made up out of an event that occurred at the time of puberty, and of two pictures, one of which I had seen just shortly before the dream. The two pictures were *The Surprise in the Bath*, from Schwind's Cycle of the Melusine (note the bathers suddenly separating), and a picture of *The Flood*, by an Italian master. The little incident was that I once witnessed a lady, who had tarried in the swimming-bath until the men's hour, being helped out of the water by the swimming-master. The scene in the dream which was selected for analysis led to a whole group of reminiscences, each one of which had contributed to the dream content. First of all came the little episode from the time of

my courting, of which I have already spoken; the pressure of a hand under the table gave rise in the dream to the "under the table," which I had subsequently to find a place for in my recollection. There was, of course, at the time not a word about "undivided attention." Analysis taught me that this factor is the realisation of a desire through its contradictory and related to the behaviour of my wife at the table d'hôte. An exactly similar and much more important episode of our courtship, one which separated us for an entire day, lies hidden behind this recent recollection. The intimacy, the hand resting upon the knee, refers to a quite different connection and to quite other persons. This element in the dream becomes again the starting-point of two distinct series of reminiscences, and so on.

The stuff of the dream thoughts which has been accumulated for the formation of the dream scene must be naturally fit for this application. There must be one or

more common factors. The dream work proceeds like Francis Galton with his family photographs. The different elements are put one on top of the other; what is common to the composite picture stands out clearly, the opposing details cancel each other. This process of reproduction partly explains the wavering statements, of a peculiar vagueness, in so many elements of the dream. For the interpretation of dreams this rule holds good: When analysis discloses *uncertainty* as to *either—or* read *and*, taking each section of the apparent alternatives as a separate outlet for a series of impressions.

When there is nothing in common between the dream thoughts, the dream work takes the trouble to create a something, in order to make a common presentation feasible in the dream. The simplest way to approximate two dream thoughts, which have as yet nothing in common, consists in making such a change in the actual expression of one idea as will meet a slight responsive recasting in the form of the

other idea. The process is analogous to that of rhyme, when consonance supplies the desired common factor. A good deal of the dream work consists in the creation of those frequently very witty, but often exaggerated, digressions. These vary from the common presentation in the dream content to dream thoughts which are as varied as are the causes in form and essence which give rise to them. In the analysis of our example of a dream, I find a like case of the transformation of a thought in order that it might agree with another essentially foreign one. In following out the analysis I struck upon the thought: *I should like to have something for nothing*. But this formula is not serviceable to the dream. Hence it is replaced by another one: "I should like to enjoy something free of cost."\* The word "kost" (taste), with its double

\* "Ich möchte gerne etwas geniessen ohne 'Kosten' zu haben." A pun upon the word "kosten," which has two meanings—"taste" and "cost." In "Die Traumdeutung," third

meaning, is appropriate to a table d'hôte; it, moreover, is in place through the special sense in the dream. At home if there is a dish which the children decline, their mother first tries gentle persuasion, with a "Just taste it." That the dream work should unhesitatingly use the double meaning of the word is certainly remarkable; ample experience has shown, however, that the occurrence is quite usual.

Through condensation of the dream certain constituent parts of its content are explicable which are peculiar to the dream life alone, and which are not found in the waking state. Such are the composite and mixed persons, the extraordinary mixed

---

edition, p. 71 footnote, Professor Freud remarks that "the finest example of dream interpretation left us by the ancients is based upon a pun" (from "The Interpretation of Dreams," by Artemidorus Daldianus). "Moreover, dreams are so intimately bound up with language that Ferenczi truly points out that every tongue has its own language of dreams. A dream is as a rule untranslatable into other languages."—TRANSLATOR.

figures, creations comparable with the fantastic animal compositions of Orientals; a moment's thought and these are reduced to unity, whilst the fancies of the dream are ever formed anew in an inexhaustible profusion. Everyone knows such images in his own dreams; manifold are their origins. I can build up a person by borrowing one feature from one person and one from another, or by giving to the form of one the name of another in my dream. I can also visualise one person, but place him in a position which has occurred to another. There is a meaning in all these cases when different persons are amalgamated into one substitute. Such cases denote an "and," a "just like," a comparison of the original person from a certain point of view, a comparison which can be also realised in the dream itself. As a rule, however, the identity of the blended persons is only discoverable by analysis, and is only indicated in the dream content by the formation of the "combined" person.

The same diversity in their ways of formation and the same rules for its solution hold good also for the innumerable medley of dream contents, examples of which I need scarcely adduce. Their strangeness quite disappears when we resolve not to place them on a level with the objects of perception as known to us when awake, but to remember that they represent the art of dream condensation by an exclusion of unnecessary detail. Prominence is given to the common character of the combination. Analysis must also generally supply the common features. The dream says simply: *All these things have an "x" in common.* The decomposition of these mixed images by analysis is often the quickest way to an interpretation of the dream. Thus I once dreamt that I was sitting with one of my former university tutors on a bench, which was undergoing a rapid continuous movement amidst other benches. This was a combination of lecture-room and moving staircase. I will not pursue the further

result of the thought. Another time I was sitting in a carriage, and on my lap an object in shape like a top-hat, which, however, was made of transparent glass. The scene at once brought to my mind the proverb: "He who keeps his hat in his hand will travel safely through the land." By a slight turn the *glass hat* reminded me of *Auer's light*, and I knew that I was about to invent something which was to make me as rich and independent as his invention had made my countryman, Dr. Auer, of Welsbach; then I should be able to travel instead of remaining in Vienna. In the dream I was travelling with my invention, with the, it is true, rather awkward glass top-hat. The dream work is peculiarly adept at representing two contradictory conceptions by means of the same mixed image. Thus, for instance, a woman dreamt of herself carrying a tall flower-stalk, as in the picture of the Annunciation (Chastity-Mary is her own name), but the stalk was bedecked with thick white blossoms resem-

bling camellias (contrast with chastity : La dame aux Camélias).

A great deal of what we have called "dream condensation" can be thus formulated. Each one of the elements of the dream content is *overdetermined* by the matter of the dream thoughts; it is not derived from one element of these thoughts, but from a whole series. These are not necessarily interconnected in any way, but may belong to the most diverse spheres of thought. The dream element truly represents all this disparate matter in the dream content. Analysis, moreover, discloses another side of the relationship between dream content and dream thoughts. Just as one element of the dream leads to associations with several dream thoughts, so, as a rule, the *one dream thought represents more than one dream element*. The threads of the association do not simply converge from the dream thoughts to the dream content, but on the way they overlap and interweave in every way.

Next to the transformation of one thought in the scene (its “dramatisation”), condensation is the most important and most characteristic feature of the dream work. We have as yet no clue as to the motive calling for such compression of the content.

## V.

IN the complicated and intricate dreams with which we are now concerned, condensation and dramatisation do not wholly account for the difference between dream contents and dream thoughts. There is evidence of a third factor, which deserves careful consideration.

When I have arrived at an understanding of the dream thoughts by my analysis I notice, above all, that the matter of the manifest is very different from that of the latent dream content. That is, I admit, only an apparent difference which vanishes on closer investigation, for in the end I find the whole dream content carried out in the dream thoughts, nearly all the dream thoughts again represented in the dream content. Nevertheless, there does remain a certain amount of difference.

The essential content which stood out

clearly and broadly in the dream must, after analysis, rest satisfied with a very subordinate rôle among the dream thoughts. These very dream thoughts which, going by my feelings, have a claim to the greatest importance are either not present at all in the dream content, or are represented by some remote allusion in some obscure region of the dream. I can thus describe these phenomena: *During the dream work the psychical intensity of those thoughts and conceptions to which it properly pertains flows to others which, in my judgment, have no claim to such emphasis.* There is no other process which contributes so much to concealment of the dream's meaning and to make the connection between the dream content and dream ideas irreconisable. During this process, which I will call *the dream displacement*, I notice also the psychical intensity, significance, or emotional nature of the thoughts become transposed in sensory vividness. What was clearest in the dream seems to me, without further

consideration, the most important; but often in some obscure element of the dream I can recognise the most direct offspring of the principal dream thought.

I could only designate this dream displacement as the *transvaluation of psychical values*. The phenomena will not have been considered in all its bearings unless I add that this displacement or transvaluation is shared by different dreams in extremely varying degrees. There are dreams which take place almost without any displacement. These have the same time, meaning, and intelligibility as we found in the dreams which recorded a desire. In other dreams not a bit of the dream idea has retained its own psychical value, or everything essential in these dream ideas has been replaced by unessentials, whilst every kind of transition between these conditions can be found. The more obscure and intricate a dream is, the greater is the part to be ascribed to the impetus of displacement in its formation.

The example that we chose for analysis shows, at least, this much of displacement—that its content has a different centre of interest from that of the dream ideas. In the forefront of the dream content the main scene appears as if a woman wished to make advances to me; in the dream idea the chief interest rests on the desire to enjoy disinterested love which shall “cost nothing”; this idea lies at the back of the talk about the beautiful eyes and the far-fetched allusion to “spinach.”

If we abolish the dream displacement, we attain through analysis quite certain conclusions regarding two problems of the dream which are most disputed—as to what provokes a dream at all, and as to the connection of the dream with our waking life. There are dreams which at once expose their links with the events of the day; in others no trace of such a connection can be found. By the aid of analysis it can be shown that every dream, without any exception, is linked up with our impression of

the day, or perhaps it would be more correct to say of the day previous to the dream. The impressions which have incited the dream may be so important that we are not surprised at our being occupied with them whilst awake; in this case we are right in saying that the dream carries on the chief interest of our waking life. More usually, however, when the dream contains anything relating to the impressions of the day, it is so trivial, unimportant, and so deserving of oblivion, that we can only recall it with an effort. The dream content appears, then, even when coherent and intelligible, to be concerned with those indifferent trifles of thought undeserving of our waking interest. The depreciation of dreams is largely due to the predominance of the indifferent and the worthless in their content.

Analysis destroys the appearance upon which this derogatory judgment is based. When the dream content discloses nothing but some indifferent impression as instigating the dream, analysis ever indicates

some significant event, which has been replaced by something indifferent with which it has entered into abundant associations. Where the dream is concerned with uninteresting and unimportant conceptions, analysis reveals the numerous associative paths which connect the trivial with the momentous in the psychical estimation of the individual. *It is only the action of displacement if what is indifferent obtains recognition in the dream content instead of those impressions which are really the stimulus, or instead of the things of real interest.* In answering the question as to what provokes the dream, as to the connection of the dream, in the daily troubles, we must say, in terms of the insight given us by replacing the manifest latent dream content: *The dream does never trouble itself about things which are not deserving of our concern during the day, and trivialities which do not trouble us during the day have no power to pursue us whilst asleep.*

What provoked the dream in the ex-

ample which we have analysed? The really unimportant event, that a friend invited me to a *free ride in his cab*. The table d'hôte scene in the dream contains an allusion to this indifferent motive, for in conversation I had brought the taxi parallel with the table d'hôte. But I can indicate the important event which has as its substitute the trivial one. A few days before I had disbursed a large sum of money for a member of my family who is very dear to me. Small wonder, says the dream thought, if this person is grateful to me for this—this love is not cost-free. But love that shall cost nothing is one of the prime thoughts of the dream. The fact that shortly before this I had had several *drives* with the relative in question puts the one drive with my friend in a position to recall the connection with the other person. The indifferent impression which, by such ramifications, provokes the dream is subservient to another condition which is not true of the real source of the dream—the impression

must be a recent one, everything arising from the day of the dream.

I cannot leave the question of dream displacement without the consideration of a remarkable process in the formation of dreams in which condensation and displacement work together towards one end. In condensation we have already considered the case where two conceptions in the dream having something in common, some point of contact, are replaced in the dream content by a mixed image, where the distinct germ corresponds to what is common, and the indistinct secondary modifications to what is distinctive. If displacement is added to condensation, there is no formation of a mixed image, but a *common mean* which bears the same relationship to the individual elements as does the resultant in the parallelogram of forces to its components. In one of my dreams, for instance, there is talk of an injection with *propyl*. On first analysis I discovered an indifferent but true incident where *amyl*

played a part as the excitant of the dream. I cannot yet vindicate the exchange of amyl for propyl. To the round of ideas of the same dream, however, there belongs the recollection of my first visit to Munich, when the *Propylæa* struck me. The attendant circumstances of the analysis render it admissible that the influence of this second group of conceptions caused the displacement of amyl to propyl. *Propyl* is, so to say, the mean idea between *amyl* and *propylæa*; it got into the dream as a kind of *compromise* by simultaneous condensation and displacement.

The need of discovering some motive for this bewildering work of the dream is even more called for in the case of displacement than in condensation.

## VI.

ALTHOUGH the work of displacement must be held mainly responsible if the dream thoughts are not refound or recognised in the dream content (unless the motive of the changes be guessed), it is another and milder kind of transformation which will be considered with the dream thoughts which leads to the discovery of a new but readily understood act of the dream work. The first dream thoughts which are unravelled by analysis frequently strike one by their unusual wording. They do not appear to be expressed in the sober form which our thinking prefers; rather are they expressed symbolically by allegories and metaphors like the figurative language of the poets. It is not difficult to find the motives for this degree of constraint in the expression of dream ideas. The dream content consists

chiefly of visual scenes; hence the dream ideas must, in the first place, be prepared to make use of these forms of presentation. Conceive that a political leader's or a barrister's address had to be transposed into pantomime, and it will be easy to understand the transformations to which the dream work is constrained by regard for this *dramatisation of the dream content*.

Around the psychical stuff of dream thoughts there are ever found reminiscences of impressions, not infrequently of early childhood—scenes which, as a rule, have been visually grasped. Whenever possible, this portion of the dream ideas exercises a definite influence upon the modelling of the dream content; it works like a centre of crystallisation, by attracting and rearranging the stuff of the dream thoughts. The scene of the dream is not infrequently nothing but a modified repetition, complicated by interpolations of events that have left such an impression; the dream but very

seldom reproduces accurate and unmixed reproductions of real scenes.

The dream content does not, however, consist exclusively of scenes, but it also includes scattered fragments of visual images, conversations, and even bits of unchanged thoughts. It will be perhaps to the point if we instance in the briefest way the means of dramatisation which are at the disposal of the dream work for the repetition of the dream thoughts in the peculiar language of the dream.

The dream thoughts which we learn from the analysis exhibit themselves as a psychological complex of the most complicated superstructure. Their parts stand in the most diverse relationship to each other; they form backgrounds and foregrounds, stipulations, digressions, illustrations, demonstrations, and protestations. It may be said to be almost the rule that one train of thought is followed by its contradictory. No feature known to our reason whilst awake is absent. If a dream is to grow out

of all this, the psychical matter is submitted to a pressure which condenses it extremely, to an inner shrinking and displacement, creating at the same time fresh surfaces, to a selective interweaving among the constituents best adapted for the construction of these scenes. Having regard to the origin of this stuff, the term *regression* can be fairly applied to this process. The logical chains which hitherto held the psychical stuff together become lost in this transformation to the dream content. The dream work takes on, as it were, only the essential content of the dream thoughts for elaboration. It is left to analysis to restore the connection which the dream work has destroyed.

The dream's means of expression must therefore be regarded as meagre in comparison with those of our imagination, though the dream does not renounce all claims to the restitution of logical relation to the dream thoughts. It rather succeeds with tolerable frequency in re-

placing these by formal characters of its own.

By reason of the undoubted connection existing between all the parts of dream thoughts, the dream is able to embody this matter into a single scene. It upholds a *logical connection* as *approximation in time and space*, just as the painter, who groups all the poets for his picture of Parnassus who, though they have never been all together on a mountain peak, yet form ideally a community. The dream continues this method of presentation in individual dreams, and often when it displays two elements close together in the dream content it warrants some special inner connection between what they represent in the dream thoughts. It should be, moreover, observed that all the dreams of one night prove on analysis to originate from the same sphere of thought.

The causal connection between two ideas is either left without presentation, or replaced by two different long portions of

dreams one after the other. This presentation is frequently a reversed one, the beginning of the dream being the deduction, and its end the hypothesis. The direct *transformation* of one thing into another in the dream seems to serve the relationship of *cause* and *effect*.

The dream never utters the *alternative* "either-or," but accepts both as having equal rights in the same connection. When "either-or" is used in the reproduction of dreams, it is, as I have already mentioned, to be replaced by "*and*."

Conceptions which stand in opposition to one another are preferably expressed in dreams by the same element.\* There

\* It is worthy of remark that eminent philologists maintain that the oldest languages used the same word for expressing quite general antitheses. In C. Abel's essay, "Ueber den Gegen-sinn der Urwörter" (1884), the following examples of such words in English are given: "gleam — gloom"; "to lock — loch"; "down — The Downs"; "to step—to stop." In his essay on "The Origin of Language" ("Linguistic Essays,"

seems no "not" in dreams. Opposition between two ideas, the relation of conversion, is represented in dreams in a very remarkable way. It is expressed by the reversal of another part of the dream content just as if by way of appendix. We shall later on deal with another form of expressing disagreement. The common dream sensation of *movement checked* serves the purpose of representing disagreement of impulses—a *conflict of the will*.

Only one of the logical relationships—that of *similarity, identity, agreement*—is found highly developed in the mechanism of

---

p. 240), Abel says: "When the Englishman says 'without,' is not his judgment based upon the comparative juxtaposition of two opposites, 'with' and 'out'; 'with' itself originally meant 'without,' as may still be seen in 'withdraw.' 'Bid' includes the opposite sense of giving and of proffering" (Abel, "The English Verbs of Command," "Linguistic Essays," p. 104; see also Freud, "Ueber den Gegensinn der Urworte": *Jahrbuch für Psychoanalytische und Psychopathologische Forschungen*, Band ii., part i., p. 179).—TRANSLATOR.

dream formation. Dream work makes use of these cases as a starting-point for condensation, drawing together everything which shows such agreement to a *fresh unity*.

These short, crude observations naturally do not suffice as an estimate of the abundance of the dream's formal means of presenting the logical relationships of the dream thoughts. In this respect, individual dreams are worked up more nicely or more carelessly, our text will have been followed more or less closely, auxiliaries of the dream work will have been taken more or less into consideration. In the latter case they appear obscure, intricate, incoherent. When the dream appears openly absurd, when it contains an obvious paradox in its content, it is so of purpose. Through its apparent disregard of all logical claims, it expresses a part of the intellectual content of the dream ideas. Absurdity in the dream denotes *disagreement, scorn, disdain* in the dream thoughts. As this explanation is in entire disagreement

with the view that the dream owes its origin to dissociated, uncritical cerebral activity, I will emphasise my view by an example:

*“ One of my acquaintances, Mr. M——, has been attacked by no less a person than Goethe in an essay with, we all maintain, unwarrantable violence. Mr. M—— has naturally been ruined by this attack. He complains very bitterly of this at a dinner-party, but his respect for Goethe has not diminished through this personal experience. I now attempt to clear up the chronological relations which strike me as improbable. Goethe died in 1832. As his attack upon Mr. M—— must, of course, have taken place before, Mr. M—— must have been then a very young man. It seems to me plausible that he was eighteen. I am not certain, however, what year we are actually in, and the whole calculation falls into obscurity. The attack was, moreover, contained in Goethe’s well-known essay on ‘ Nature.’ ”*

The absurdity of the dream becomes the more glaring when I state that Mr. M—— is

a young business man without any poetical or literary interests. My analysis of the dream will show what method there is in this madness. The dream has derived its material from three sources:

1. Mr. M——, to whom I was introduced at a dinner-party, begged me one day to examine his elder brother, who showed signs of mental trouble. In conversation with the patient, an unpleasant episode occurred. Without the slightest occasion he disclosed one of his brother's *youthful escapades*. I had asked the patient the *year of his birth* (*year of death* in dream), and led him to various calculations which might show up his want of memory.

2. A medical journal which displayed my name among others on the cover had published a *ruinous* review of a book by my friend F—— of Berlin, from the pen of a very *juvenile* reviewer. I communicated with the editor, who, indeed, expressed his regret, but would not promise any redress. Thereupon I broke off my connection with

the paper; in my letter of resignation I expressed the hope that our *personal relations would not suffer from this*. Here is the real source of the dream. The derogatory reception of my friend's work had made a deep impression upon me. In my judgment, it contained a fundamental biological discovery which only now, several years later, commences to find favour among the professors.

3. A little while before, a patient gave me the medical history of her brother, who, exclaiming "*Nature, Nature!*" had gone out of his mind. The doctors considered that the exclamation arose from a study of *Goethe's* beautiful essay, and indicated that the patient had been overworking. I expressed the opinion that it seemed more *plausible* to me that the exclamation "*Nature!*" was to be taken in that sexual meaning known also to the less educated in our country. It seemed to me that this view had something in it, because the unfortunate youth afterwards mutilated his

genital organs. The patient was eighteen years old when the attack occurred.

The first person in the dream-thoughts behind the ego was my friend who had been so scandalously treated. "*I now attempted to clear up the chronological relations.*" My friend's book deals with the chronological relations of life, and, amongst other things, correlates *Goethe's* duration of life with a number of days in many ways important to biology. The ego is, however, represented as a general paralytic ("*I am not certain what year we are actually in*"). The dream exhibits my friend as behaving like a general paralytic, and thus riots in absurdity. But the dream thoughts run ironically. "Of course he is a madman, a fool, and you are the genius who understands all about it. But shouldn't it be the *other way round?*" This inversion obviously took place in the dream when Goethe attacked the young man, which is absurd, whilst anyone, however young, can to-day easily attack the great Goethe.

I am prepared to maintain that no dream is inspired by other than egoistic emotions. The ego in the dream does not, indeed, represent only my friend, but stands for myself also. I identify myself with him because the fate of his discovery appears to me typical of the acceptance *of my own*. If I were to publish my own theory, which gives sexuality predominance in the ætiology of psycho-neurotic disorders (see the allusion to the eighteen-year-old patient—" *Nature, Nature!*"), the same criticism would be levelled at me, and it would even now meet with the same contempt.

When I follow out the dream thoughts closely, I ever find only *scorn* and *contempt* as *correlated with the dream's absurdity*. It is well known that the discovery of a cracked sheep's skull on the Lido in Venice gave Goethe the hint for the so-called vertebral theory of the skull. My friend plumes himself on having as a student raised a hubbub for the resignation of an aged professor who had done good work

(including some in this very subject of comparative anatomy), but who, on account of *decrepitude*, had become quite incapable of teaching. The agitation my friend inspired was so successful because in the German Universities an *age limit* is not demanded for academic work. *Age is no protection against folly*. In the hospital here I had for years the honour to serve under a chief who, long fossilised, was for decades notoriously *feeble-minded*, and was yet permitted to continue in his responsible office. A trait, after the manner of the find in the Lido, forces itself upon me here. It was to this man that some youthful colleagues in the hospital adapted the then popular slang of that day: "No Goethe has written that," "No Schiller composed that," etc.

## VII.

WE have not exhausted our valuation of the dream work. In addition to condensation, displacement, and definite arrangement of the psychical matter, we must ascribe to it yet another activity—one which is, indeed, not shared by every dream. I shall not treat this position of the dream work exhaustively; I will only point out that the readiest way to arrive at a conception of it is to take for granted, probably unfairly, that it *only subsequently influences the dream content which has already been built up*. Its mode of action thus consists in so co-ordinating the parts of the dream that these coalesce to a coherent whole, to a dream composition. The dream gets a kind of façade which, it is true, does not conceal the whole of its content. There is a sort of preliminary explanation to be

strengthened by interpolations and slight alterations. Such elaboration of the dream content must not be too pronounced; the misconception of the dream thoughts to which it gives rise is merely superficial, and our first piece of work in analysing a dream is to get rid of these early attempts at interpretation.

The motives for this part of the dream work are easily gauged. This final elaboration of the dream is due to a *regard for intelligibility*—a fact at once betraying the origin of an action which behaves towards the actual dream content just as our normal psychical action behaves towards some proffered perception that is to our liking. The dream content is thus secured under the pretence of certain expectations, is perceptually classified by the supposition of its intelligibility, thereby risking its falsification, whilst, in fact, the most extraordinary misconceptions arise if the dream can be correlated with nothing familiar. Everyone is aware that we are unable to look at

any series of unfamiliar signs, or to listen to a discussion of unknown words, without at once making perpetual changes through *our regard for intelligibility*, through our falling back upon what is familiar.

We can call those dreams *properly made up* which are the result of an elaboration in every way analogous to the psychical action of our waking life. In other dreams there is no such action; not even an attempt is made to bring about order and meaning. We regard the dream as "quite mad," because on awaking it is with this last-named part of the dream work, the dream elaboration, that we identify ourselves. So far, however, as our analysis is concerned, the dream, which resembles a medley of disconnected fragments, is of as much value as the one with a smooth and beautifully polished surface. In the former case we are spared, to some extent, the trouble of breaking down the super-elaboration of the dream content.

All the same, it would be an error to see

in the dream façade nothing but the misunderstood and somewhat arbitrary elaboration of the dream carried out at the instance of our psychical life. Wishes and phantasies are not infrequently employed in the erection of this façade, which were already fashioned in the dream thoughts; they are akin to those of our waking life—"day-dreams," as they are very properly called. These wishes and phantasies, which analysis discloses in our dreams at night, often present themselves as repetitions and refashionings of the scenes of infancy. Thus the dream façade may show us directly the true core of the dream, distorted through admixture with other matter.

Beyond these four activities there is nothing else to be discovered in the dream work. If we keep closely to the definition that dream work denotes the transference of dream thoughts to dream content, we are compelled to say that the dream work is not creative; it develops no fancies of its own, it judges nothing, decides nothing. It

does nothing but prepare the matter for condensation and displacement, and refashions it for dramatisation, to which must be added the inconstant last-named mechanism—that of explanatory elaboration. It is true that a good deal is found in the dream content which might be understood as the result of another and more intellectual performance; but analysis shows conclusively every time that these *intellectual operations were already present in the dream thoughts, and have only been taken over by the dream content*. A syllogism in the dream is nothing other than the repetition of a syllogism in the dream thoughts; it seems inoffensive if it has been transferred to the dream without alteration; it becomes absurd if in the dream work it has been transferred to other matter. A calculation in the dream content simply means that there was a calculation in the dream thoughts; whilst this is always correct, the calculation in the dream can furnish the silliest results by the condensation of its

factors and the displacement of the same operations to other things. Even speeches which are found in the dream content are not new compositions; they prove to be pieced together out of speeches which have been made or heard or read; the words are faithfully copied, but the occasion of their utterance is quite overlooked, and their meaning is most violently changed.

It is, perhaps, not superfluous to support these assertions by examples :

I. *A seemingly inoffensive, well-made dream of a patient. She was going to market with her cook, who carried the basket. The butcher said to her when she asked him for something: "That is all gone," and wished to give her something else, remarking: "That's very good." She declines, and goes to the greengrocer, who wants to sell her a peculiar vegetable which is bound up in bundles and of a black colour. She says: "I don't know that; I won't take it."*

The remark "That is all gone" arose from the treatment. A few days before I

said myself to the patient that the earliest reminiscences of childhood *are all gone* as such, but are replaced by transferences and dreams. Thus I am the butcher.

The second remark, "*I don't know that,*" arose in a very different connection. The day before she had herself called out in rebuke to the cook (who, moreover, also appears in the dream): "*Behave yourself properly ; I don't know that*"—that is, "I don't know this kind of behaviour; I won't have it." The more harmless portion of this speech was arrived at by a displacement of the dream content; in the dream thoughts only the other portion of the speech played a part, because the dream work changed an imaginary situation into utter irrecongnisability and complete inoffensiveness (while in a certain sense I behave in an unseemly way to the lady). The situation resulting in this phantasy is, however, nothing but a new edition of one that actually took place.

2. A dream apparently meaningless relates to figures. "*She wants to pay some-*

*thing ; her daughter takes three florins sixty-five kreuzers out of her purse ; but she says : ' What are you doing ? It only costs twenty-one kreuzers.' "*

The dreamer was a stranger who had placed her child at school in Vienna, and who was able to continue under my treatment so long as her daughter remained at Vienna. The day before the dream the directress of the school had recommended her to keep the child another year at school. In this case she would have been able to prolong her treatment by one year. The figures in the dream become important if it be remembered that time is money. One year equals 365 days, or, expressed in kreuzers, 365 kreuzers, which is three florins sixty-five kreuzers. The twenty-one kreuzers correspond with the three weeks which remained from the day of the dream to the end of the school term, and thus to the end of the treatment. It was obviously financial considerations which had moved the lady to refuse the proposal of the directress,

and which were answerable for the triviality of the amount in the dream.

3. A lady, young, but already ten years married, heard that a friend of hers, Miss Elise L——, of about the same age, had become engaged. This gave rise to the following dream:

*She was sitting with her husband in the theatre ; the one side of the stalls was quite empty. Her husband tells her, Elise L—— and her fiancé had intended coming, but could only get some cheap seats, three for one florin fifty kreuzers, and these they would not take. In her opinion, that would not have mattered very much.*

The origin of the figures from the matter of the dream thoughts and the changes the figures underwent are of interest. Whence came the one florin fifty kreuzers? From a trifling occurrence of the previous day. Her sister-in-law had received 150 florins as a present from her husband, and had quickly got rid of it by buying some ornament. Note that 150 florins is one hundred

times one florin fifty kreuzers. For the *three* concerned with the tickets, the only link is that Elise L—— is exactly three months younger than the dreamer. The scene in the dream is the repetition of a little adventure for which she has often been teased by her husband. She was once in a great hurry to get tickets in time for a piece, and when she came to the theatre *one side of the stalls was almost empty*. It was therefore quite unnecessary for her to have been in *such a hurry*. Nor must we overlook the absurdity of the dream that two persons should take three tickets for the theatre.

Now for the dream ideas. It was *stupid* to have married so early; I *need not* have been *in so great a hurry*. Elise L——'s example shows me that I should have been able to get a husband later; indeed, one a *hundred times better* if I had but waited. I could have bought *three* such men with the money (dowry).

## VIII.

IN the foregoing exposition we have now learnt something of the dream work; we must regard it as a quite special psychical process, which, so far as we are aware, resembles nothing else. To the dream work has been transferred that bewilderment which its product, the dream, has aroused in us. In truth, the dream work is only the first recognition of a group of psychical processes to which must be referred the origin of hysterical symptoms, the ideas of morbid dread, obsession, and illusion. Condensation, and especially displacement, are never-failing features in these other processes. The regard for appearance remains, on the other hand, peculiar to the dream work. If this explanation brings the dream into line with the formation of psychical disease, it becomes the more important to fathom

the essential conditions of processes like dream building. It will be probably a surprise to hear that neither the state of sleep nor illness is among the indispensable conditions. A whole number of phenomena of the everyday life of healthy persons, forgetfulness, slips in speaking and in holding things, together with a certain class of mistakes, are due to a psychical mechanism analogous to that of the dream and the other members of this group.

Displacement is the core of the problem, and the most striking of all the dream performances. A thorough investigation of the subject shows that the essential condition of displacement is purely psychological; it is in the nature of a motive. We get on the track by thrashing out experiences which one cannot avoid in the analysis of dreams. I had to break off the relations of my dream thoughts in the analysis of my dream on p. 11 because I found some experiences which I do not wish strangers to know, and which I could not relate without

serious damage to important considerations. I added, it would be no use were I to select another instead of that particular dream; in every dream where the content is obscure or intricate, I should hit upon dream thoughts which call for secrecy. If, however, I continue the analysis for myself, without regard to those others, for whom, indeed, so personal an event as my dream cannot matter, I arrive finally at ideas which surprise me, which I have not known to be mine, which not only appear *foreign* to me, but which are *unpleasant*, and which I would like to oppose vehemently, whilst the chain of ideas running through the analysis intrudes upon me inexorably. I can only take these circumstances into account by admitting that these thoughts are actually part of my psychical life, possessing a certain psychical intensity or energy. However, by virtue of a particular psychological condition, the *thoughts could not become conscious to me*. I call this particular condition "*Repression*." It is therefore

impossible for me not to recognise some causal relationship between the obscurity of the dream content and this state of repression—this *incapacity of consciousness*. Whence I conclude that the cause of the obscurity is *the desire to conceal these thoughts*. Thus I arrive at the conception of the *dream distortion* as the deed of the dream work, and of *displacement* serving to disguise this object.

I will test this in my own dream, and ask myself, What is the thought which, quite innocuous in its distorted form, provokes my liveliest opposition in its real form? I remember that the free drive reminded me of the last expensive drive with a member of my family, the interpretation of the dream being: I should for once like to experience affection for which I should not have to pay, and that shortly before the dream I had to make a heavy disbursement for this very person. In this connection, I cannot get away from the thought *that I regret this disbursement*. It is only when I

acknowledge this feeling that there is any sense in my wishing in the dream for an affection that should entail no outlay. And yet I can state on my honour that I did not hesitate for a moment when it became necessary to expend that sum. The regret, the counter-current, was unconscious to me. Why it was unconscious is quite another question which would lead us far away from the answer which, though within my knowledge, belongs elsewhere.

If I subject the dream of another person instead of one of my own to analysis, the result is the same; the motives for convincing others is, however, changed. In the dream of a healthy person the only way for me to enable him to accept this repressed idea is the coherence of the dream thoughts. He is at liberty to reject this explanation. But if we are dealing with a person suffering from any neurosis—say from hysteria—the recognition of these repressed ideas is compulsory by reason of their connection with the symptoms of his

illness and of the improvement resulting from exchanging the symptoms for the repressed ideas. Take the patient from whom I got the last dream about the three tickets for one florin fifty kreuzers. Analysis shows that she does not think highly of her husband, that she regrets having married him, that she would be glad to change him for someone else. It is true that she maintains that she loves her husband, that her emotional life knows nothing about this depreciation (a hundred times better !), but all her symptoms lead to the same conclusion as this dream. When her repressed memories had reawakened a certain period when she was conscious that she did not love her husband, her symptoms disappeared, and therewith disappeared her resistance to the interpretation of the dream.

## IX.

THIS conception of repression once fixed, together with the distortion of the dream in relation to repressed psychological matter, we are in a position to give a general exposition of the principal results which the analysis of dreams supplies. We learnt that the most intelligible and meaningful dreams are unrealised desires; the desires they pictured as realised are known to consciousness, have been held over from the daytime, and are of absorbing interest. The analysis of obscure and intricate dreams discloses something very similar; the dream scene again pictures as realised some desire which regularly proceeds from the dream ideas, but the picture is unrecognisable, and is only cleared up in the analysis. The desire itself is either one repressed, foreign to consciousness, or it is closely bound up with

repressed ideas. The formula for these dreams may be thus stated: *They are concealed realisations of repressed desires.* It is interesting to note that they are right who regard the dream as foretelling the future. Although the future which the dream shows us is not that which will occur, but that which we would like to occur. Folk psychology proceeds here according to its wont; it believes what it wishes to believe.

Dreams can be divided into three classes according to their relation towards the realisation of desire. Firstly come those which exhibit a *non-repressed, non-concealed desire*; these are dreams of the infantile type, becoming ever rarer among adults. Secondly, dreams which express in *veiled* form some *repressed desire*; these constitute by far the larger number of our dreams, and they require analysis for their understanding. Thirdly, these dreams where repression exists, but *without* or with but slight concealment. These dreams are invariably accompanied by a feeling of dread

which brings the dream to an end. This feeling of dread here replaces dream displacement; I regarded the dream work as having prevented this in the dream of the second class. It is not very difficult to prove that what is now present as intense dread in the dream was once desire, and is now secondary to the repression.

There are also definite dreams with a painful content, without the presence of any anxiety in the dream. These cannot be reckoned among dreams of dread; they have, however, always been used to prove the unimportance and the psychical futility of dreams. An analysis of such an example will show that it belongs to our second class of dreams—a *perfectly concealed* realisation of repressed desires. Analysis will demonstrate at the same time how excellently adapted is the work of displacement to the concealment of desires.

A girl dreamt that she saw lying dead before her the only surviving child of her sister amid the same surroundings as a few years before she saw the first child lying

dead. She was not sensible of any pain, but naturally combated the view that the scene represented a desire of hers. Nor was that view necessary. Years ago it was at the funeral of the child that she had last seen and spoken to the man she loved. Were the second child to die, she would be sure to meet this man again in her sister's house. She is longing to meet him, but struggles against this feeling. The day of the dream she had taken a ticket for a lecture, which announced the presence of the man she always loved. The dream is simply a dream of impatience common to those which happen before a journey, theatre, or simply anticipated pleasures. The longing is concealed by the shifting of the scene to the occasion when any joyous feeling were out of place, and yet where it did once exist. Note, further, that the emotional behaviour in the dream is adapted, not to the displaced, but to the real but suppressed dream ideas. The scene anticipates the long-hoped-for meeting; there is here no call for painful emotions.

## X.

THERE has hitherto been no occasion for philosophers to bestir themselves with a psychology of repression. We must be allowed to construct some clear conception as to the origin of dreams as the first steps in this unknown territory. The scheme which we have formulated not only from a study of dreams is, it is true, already somewhat complicated, but we cannot find any simpler one that will suffice. We hold that our psychical apparatus contains two procedures for the construction of thoughts. The second one has the advantage that its products find an open path to consciousness, whilst the activity of the first procedure is unknown to itself, and can only arrive at consciousness through the second one. At the borderland of these two procedures, where the first passes over into the second,

a censorship is established which only passes what pleases it, keeping back everything else. That which is rejected by the censorship is, according to our definition, in a state of repression. Under certain conditions, one of which is the sleeping state, the balance of power between the two procedures is so changed that what is repressed can no longer be kept back. In the sleeping state this may possibly occur through the negligence of the censor; what has been hitherto repressed will now succeed in finding its way to consciousness. But as the censorship is never absent, but merely off guard, certain alterations must be conceded so as to placate it. It is a compromise which becomes conscious in this case—a compromise between what one procedure has in view and the demands of the other. *Repression, laxity of the censor, compromise*—this is the foundation for the origin of many another psychological process, just as it is for the dream. In such compromises we can observe the processes

of condensation, of displacement, the acceptance of superficial associations, which we have found in the dream work.

It is not for us to deny the demonic element which has played a part in constructing our explanation of dream work. The impression left is that the formation of obscure dreams proceeds as if a person had something to say which must be disagreeable for another person upon whom he is dependent to hear. It is by the use of this image that we figure to ourselves the conception of the *dream distortion* and of the censorship, and ventured to crystallise our impression in a rather crude, but at least definite, psychological theory. Whatever explanation the future may offer of these first and second procedures, we shall expect a confirmation of our correlate that the second procedure commands the entrance to consciousness, and can exclude the first from consciousness.

Once the sleeping state overcome, the censorship resumes complete sway, and is

now able to revoke that which was granted in a moment of weakness. That the *forgetting* of dreams explains this in part, at least, we are convinced by our experience, confirmed again and again. During the relation of a dream, or during analysis of one, it not infrequently happens that some fragment of the dream is suddenly forgotten. This fragment so forgotten invariably contains the best and readiest approach to an understanding of the dream. Probably that is why it sinks into oblivion—*i.e.*, into a renewed suppression.

## XI.

VIEWING the dream content as the representation of a realised desire, and referring its vagueness to the changes made by the censor in the repressed matter, it is no longer difficult to grasp the function of dreams. In fundamental contrast with those saws which assume that sleep is disturbed by dreams, we hold the *dream as the guardian of sleep*. So far as children's dreams are concerned, our view should find ready acceptance.

The sleeping state or the psychical change to sleep, whatsoever it be, is brought about by the child being sent to sleep or compelled thereto by fatigue, only assisted by the removal of all stimuli which might open other objects to the psychical apparatus. The means which serve to keep external stimuli distant are known; but what are

the means we can employ to depress the internal psychical stimuli which frustrate sleep? Look at a mother getting her child to sleep. The child is full of beseeching; he wants another kiss; he wants to play yet awhile. His requirements are in part met, in part drastically put off till the following day. Clearly these desires and needs, which agitate him, are hindrances to sleep. Everyone knows the charming story of the bad boy (Baldwin Groller's) who awoke at night bellowing out, "*I want the rhinoceros.*" A really good boy, instead of bellowing, would have *dreamt* that he was playing with the rhinoceros. Because the dream which realises his desire is believed during sleep, it removes the desire and makes sleep possible. It cannot be denied that this belief accords with the dream image, because it is arrayed in the psychical appearance of probability; the child is without the capacity which it will acquire later to distinguish hallucinations or phantasies from reality.

The adult has learnt this differentiation; he has also learnt the futility of desire, and by continuous practice manages to postpone his aspirations, until they can be granted in some roundabout method by a change in the external world. For this reason it is rare for him to have his wishes realised during sleep in the short psychical way. It is even possible that this never happens, and that everything which appears to us like a child's dream demands a much more elaborate explanation. Thus it is that for adults—for every sane person without exception—a differentiation of the psychical matter has been fashioned which the child knew not. A psychical procedure has been reached which, informed by the experience of life, exercises with jealous power a dominating and restraining influence upon psychical emotions; by its relation to consciousness, and by its spontaneous mobility, it is endowed with the greatest means of psychical power. A portion of the infantile emotions has been

withheld from this procedure as useless to life, and all the thoughts which flow from these are found in the state of repression.

Whilst the procedure in which we recognise our normal ego reposes upon the desire for sleep, it appears compelled by the psycho-physiological conditions of sleep to abandon some of the energy with which it was wont during the day to keep down what was repressed. This neglect is really harmless; however much the emotions of the child's spirit may be stirred, they find the approach to consciousness rendered difficult, and that to movement blocked in consequence of the state of sleep. The danger of their disturbing sleep must, however, be avoided. Moreover, we must admit that even in deep sleep some amount of free attention is exerted as a protection against sense-stimuli which might, perchance, make an awakening seem wiser than the continuance of sleep. Otherwise we could not explain the fact of our being always awakened by stimuli of certain

quality. As the old physiologist Burdach pointed out, the mother is awakened by the whimpering of her child, the miller by the cessation of his mill, most people by gently calling out their names. This attention, thus on the alert, makes use of the internal stimuli arising from repressed desires, and fuses them into the dream, which as a compromise satisfies both procedures at the same time. The dream creates a form of psychical release for the wish which is either suppressed or formed by the aid of repression, inasmuch as it presents it as realised. The other procedure is also satisfied, since the continuance of the sleep is assured. Our ego here gladly behaves like a child; it makes the dream pictures believable, saying, as it were, "Quite right, but let me sleep." The contempt which, once awakened, we bear the dream, and which rests upon the absurdity and apparent illogicality of the dream, is probably nothing but the reasoning of our sleeping ego on the feelings about what was re-

pressed; with greater right it should rest upon the incompetency of this disturber of our sleep. In sleep we are now and then aware of this contempt; the dream content transcends the censorship rather too much, we think, "It's only a dream," and sleep on.

It is no objection to this view if there are border-lines for the dream where its function, to preserve sleep from interruption, can no longer be maintained—as in the dreams of impending dread. It is here changed for another function—to suspend the sleep at the proper time. It acts like a conscientious night-watchman, who first does his duty by quelling disturbances so as not to waken the citizen, but equally does his duty quite properly when he awakens the street should the causes of the trouble seem to him serious and himself unable to cope with them alone.

This function of dreams becomes especially well marked when there arises some incentive for the sense perception. That

the senses aroused during sleep influence the dream is well known, and can be experimentally verified; it is one of the certain but much overestimated results of the medical investigation of dreams. Hitherto there has been an insoluble riddle connected with this discovery. The stimulus to the sense by which the investigator affects the sleeper is not properly recognised in the dream, but is intermingled with a number of indefinite interpretations, whose determination appears left to psychical free-will. There is, of course, no such psychical free-will. To an external sense-stimulus the sleeper can react in many ways. Either he awakens or he succeeds in sleeping on. In the latter case he can make use of the dream to dismiss the external stimulus, and this, again, in more ways than one. For instance, he can stay the stimulus by dreaming of a scene which is absolutely intolerable to him. This was the means used by one who was troubled by a painful perineal abscess. He dreamt

that he was on horseback, and made use of the poultice, which was intended to alleviate his pain, as a saddle, and thus got away from the cause of the trouble. Or, as is more frequently the case, the external stimulus undergoes a new rendering, which leads him to connect it with a repressed desire seeking its realisation, and robs him of its reality, and is treated as if it were a part of the psychical matter. Thus, some-one dreamt that he had written a comedy which embodied a definite *motif*; it was being performed; the first act was over amid enthusiastic applause; there was great clapping. At this moment the dreamer must have succeeded in prolonging his sleep despite the disturbance, for when he woke he no longer heard the noise; he concluded rightly that someone must have been beating a carpet or bed. The dreams which come with a loud noise just before waking have all attempted to cover the stimulus to waking by some other explanation, and thus to prolong the sleep for a little while.

## XII.

WHOSOEVER has firmly accepted this *censorship* as the chief motive for the distortion of dreams will not be surprised to learn as the result of dream interpretation that most of the dreams of adults are traced by analysis to erotic desires. This assertion is not drawn from dreams obviously of a sexual nature, which are known to all dreamers from their own experience, and are the only ones usually described as "sexual dreams." These dreams are ever sufficiently mysterious by reason of the choice of persons who are made the objects of sex, the removal of all the barriers which cry halt to the dreamer's sexual needs in his waking state, the many strange reminders as to details of what are called perversions. But analysis discovers that, in many other dreams in whose manifest con-

tent nothing erotic can be found, the work of interpretation shows them up as, in reality, realisation of sexual desires; whilst, on the other hand, that much of the thought-making when awake, the thoughts saved us as surplus from the day only, reaches presentation in dreams with the help of repressed erotic desires.

Towards the explanation of this statement, which is no theoretical postulate, it must be remembered that no other class of instincts has required so vast a suppression at the behest of civilisation as the sexual, whilst their mastery by the highest psychological processes are in most persons soonest of all relinquished. Since we have learnt to understand *infantile sexuality*, often so vague in its expression, so invariably overlooked and misunderstood, we are justified in saying that nearly every civilised person has retained at some point or other the infantile type of sex life; thus we understand that repressed infantile sex desires furnish the most frequent and most

powerful impulses for the formation of dreams \*

If the dream, which is the expression of some erotic desire, succeeds in making its manifest content appear innocently asexual, it is only possible in one way. The matter of these sexual presentations cannot be exhibited as such, but must be replaced by allusions, suggestions, and similar indirect means; differing from other cases of indirect presentation, those used in dreams must be deprived of direct understanding. The means of presentation which answer these requirements are commonly termed "symbols." A special interest has been directed towards these, since it has been observed that the dreamers of the same language use the like symbols—indeed, that in certain cases community of symbol is greater than community of speech. Since the dreamers

\* Freud, "Three Contributions to Sexual Theory," translated by A. A. Brill (*Journal of Nervous and Mental Disease* Publishing Company, New York).

do not themselves know the meaning of the symbols they use, it remains a puzzle whence arises their relationship with what they replace and denote. The fact itself is undoubted, and becomes of importance for the technique of the interpretation of dreams, since by the aid of a knowledge of this symbolism it is possible to understand the meaning of the elements of a dream, or parts of a dream, occasionally even the whole dream itself, without having to question the dreamer as to his own ideas. We thus come near to the popular idea of an interpretation of dreams, and, on the other hand, possess again the technique of the ancients, among whom the interpretation of dreams was identical with their explanation through symbolism.

Though the study of dream symbolism is far removed from finality, we now possess a series of general statements and of particular observations which are quite certain. There are symbols which practically always have the same meaning: Emperor and Em-

press (King and Queen) always mean the parents; room, a woman,\* and so on. The sexes are represented by a great variety of symbols, many of which would be at first quite incomprehensible had not the clues to the meaning been often obtained through other channels.

There are symbols of universal circulation, found in all dreamers, of one range of speech and culture; there are others of the narrowest individual significance which an individual has built up out of his own material. In the first class those can be differentiated whose claim can be at once recognised by the replacement of sexual things in common speech (those, for instance, arising from agriculture, as reproduction, seed) from others whose sexual

\* The words from "and" to "channels" in the next sentence is a short summary of the passage in the original. As this book will be read by other than professional people the passage has not been translated, in deference to English opinion.—TRANSLATOR.

references appear to reach back to the earliest times and to the obscurest depths of our image-building. The power of building symbols in both these special forms of symbols has not died out. Recently discovered things, like the airship, are at once brought into universal use as sex symbols.

It would be quite an error to suppose that a profounder knowledge of dream symbolism (the "Language of Dreams") would make us independent of questioning the dreamer regarding his impressions about the dream, and would give us back the whole technique of ancient dream interpreters. Apart from individual symbols and the variations in the use of what is general, one never knows whether an element in the dream is to be understood symbolically or in its proper meaning; the whole content of the dream is certainly not to be interpreted symbolically. The knowledge of dream symbols will only help us in understanding portions of the dream content, and does not render the use of the technical rules previ-

ously given at all superfluous. But it must be of the greatest service in interpreting a dream just when the impressions of the dreamer are withheld or are insufficient.

Dream symbolism proves also indispensable for understanding the so-called "typical" dreams and the dreams that "repeat themselves." If the value of the symbolism of dreams has been so incompletely set out in this brief portrayal, this attempt will be corrected by reference to a point of view which is of the highest import in this connection. Dream symbolism leads us far beyond the dream; it does not belong only to dreams, but is likewise dominant in legend, myth, and saga, in wit and in folklore. It compels us to pursue the inner meaning of the dream in these productions. But we must acknowledge that symbolism is not a result of the dream work, but is a peculiarity probably of our unconscious thinking, which furnishes to the dream work the matter for condensation, displacement, and dramatisation.

### XIII.

I DISCLAIM all pretension to have thrown light here upon all the problems of the dream, or to have dealt convincingly with everything here touched upon. If anyone is interested in the whole of dream literature, I refer him to the works of Sante de Sanctis (*I sogni*, Turin, 1899). For a more complete investigation of my conception of the dream, my work should be consulted: "*Die Traumdeutung*," Leipzig and Vienna, third edition, 1911.\* I will only point out in what direction my exposition on dream work should be followed up.

If I posit as the problem of dream interpretation the replacement of the dream by its latent ideas—that is, the resolution of

\* Freud, "*The Interpretation of Dreams*," third edition, translated by A. A. Brill. London: George Allen and Company, Ltd.

that which the dream work has woven— I raise a series of new psychological problems which refer to the mechanism of this dream work as well as to the nature and the conditions of this so-called repression. On the other hand, I claim the existence of dream thoughts as a very valuable foundation for psychical construction of the highest order, provided with all the signs of normal intellectual performance. This matter is, however, removed from consciousness until it is rendered in the distorted form of the dream content. I am compelled to believe that all persons have such ideas, since nearly all, even the most normal, can have dreams. To the unconsciousness of dream ideas, or their relationship to consciousness and to repression, are linked questions of the greatest psychological importance. Their solution must be postponed until the analysis of the origin of other psychopathic growths, such as the symptoms of hysteria and of obsessions, has been made clear.

## LITERATURE

For a completer study of Dream Symbolism, consult the work of Artemidorus Daldianus: *The Interpretation of Dreams*. Rendered into English by "R. W."—*i.e.*, Robert Wood. The fourth edition, newly written. B. L., London, 1644. The last edition was published in 1786.
